Kurukshetra University, Kurukshetra

(Established by the State Legislature Act-XII of 1956)
("A++" Grade, NAAC Accredited)

Syllabus
for

Post Graduate Programme

Master of Computer Applications
as per NEP-2020
Curriculum and Credit Framework for Postgraduate Programme

With Multiple Entry-Exit, Internship and CBCS-LOCF
With effect from the session 2025-26

DEPARTMENT OF COMPUTER SCIENCE AND APPLICATIONS
FACULTY OF SCIENCES

KURUKSHETRA UNIVERSITY, KURUKSHETRA -136119

With effect from the Session: 2025-26			
Part A - Introduction			
Name of the Programme	MCA		
Semester	1st		
Name of the Course	Client-side Web Technology		
Course Code	M24-CAP-101		
Course Type	CC-1		
Level of the course (As per Annexure-I	400-499		
Pre-requisite for the course (if any)	-		
Course Objectives	This course aims to provide a comprehensive understanding of front-end development using the MERN stack, covering HTML, CSS, and JavaScript basics. Students will learn about React for building dynamic user interfaces, including components, state management, and event handling. The course also explores advanced topics such as React Router, Redux for state management, and advanced hooks for managing side effects and context.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	**CLO-1**. Gain an understanding of the web development process and the components of the MERN stack, with a focus on HTML structure, CSS styling, and responsive design. **CLO-2** Develop foundational JavaScript skills, including control structures, functions, objects, arrays, and DOM manipulation for dynamic web interactions. **CLO-3** Learn the basics of React, including JSX, components, state management, lifecycle methods, and handling events and forms within React applications. **CLO-4** Master advanced React topics like React Router for navigation, state management with Redux, and using advanced hooks for managing complex state and side effects.		
Credits	Theory	Practical	Total
	4	0	4
Teaching Hours per week	4	0	4
Internal Assessment Marks	30	0	30
End Term Exam Marks	70	0	70
Max. Marks	100	0	100
Examination Time	3 hours		

Part B- Contents of the Course

Instructions for Paper- Setter: The examiner will set 9 questions asking two questions from each unit and one compulsory question by taking course learning outcomes (CLOs) into consideration. The compulsory question (Question No. 1) will consist at least 4 parts covering entire syllabus. The examinee will be required to attempt 5 questions, selecting one question from each unit and the compulsory question. All questions will carry equal marks.

Unit	Topics	Contact Hours
I	Basics of Front End Development: Overview of web development (Front End vs. Back End), Understanding the MERN stack and its components, Tools and environments (text editors, browsers, version control with Git); HTML (HyperText Markup Language): Structure of an HTML document, HTML elements and attributes, Forms and input types, Semantic HTML (header, footer, article, section, nav); CSS (Cascading Style Sheets): Basics of CSS (syntax, selectors, properties), CSS Box Model, Positioning and layout (float, flexbox, grid), Responsive design (media queries, mobile-first design).	15
II	Basics of JavaScript: Introduction to JavaScript, Variables, data types, and operators, Control structures (if, else, switch, loops); Functions and Scope: Defining and invoking functions, Function expressions and arrow functions, Scope and closures; Objects and Arrays: Creating and manipulating objects, Array methods and iteration; Regular Expressions: Introduction to RegExp, Regular expression usage, Modifiers, RegExp patterns, RegExp methods, String methods for RegExp; DOM Manipulation and Events: Selecting and manipulating DOM elements, Event handling and delegation, Creating and appending elements dynamically	15

III	Introduction to React: Overview and advantages of React, Setting up a React development environment (using Create React App); JSX (JavaScript XML): Understanding JSX syntax, Embedding expressions in JS, JSX best practices; Components and Props: Functional and class components, Props and component communication, Prop types and default props.; State and Lifecycle: Understanding state in React, State management in class components, Lifecycle methods (componentDidMount, componentDidUpdate, componentWillUnmount); Event Handling and Forms: Handling events in React, Controlled vs. uncontrolled components, Form handling and validation	15
IV	React Router: Introduction to React Router, Setting up and configuring routes, Navigating between routes and passing parameters; State Management with Redux: Introduction to Redux, Setting up Redux with React, Actions, reducers, and store, Connecting Redux to React components; Advanced Hooks: Using built-in hooks (useEffect, useContext, useReducer), Creating custom hooks, Managing side effects with useEffect	15
	Total Contact Hours	60

Suggested Evaluation Methods

Internal Assessment: 30		**End Term Examination: 70**	
➢ **Theory**	**30**	➢ **Theory**	**70**
• Class Participation:	5	Written Examination	
• Seminar/presentation/assignment/quiz/class test etc.:	10		
• Mid-Term Exam:	15

Part A - Introduction			
Name of the Programme	MCA		
Semester	1st		
Name of the Course	Operating System & Linux		
Course Code	M24-CAP-102		
Course Type	CC-2		
Level of the course (As per Annexure-I	400-499		
Pre-requisite for the course (if any)	-		
Course Objectives	This course provides a foundational understanding of operating systems, covering their definition, types, and functions. Students will explore system structures, process management, CPU scheduling, memory management, paging and segmentation, virtual memory, and file systems. Additionally, the course offers an introduction to Linux, including its history, architecture, file system, basic commands, shell scripting, process and user management, networking, system administration, and basic security concepts.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	**CLO-1.** Understand the fundamental concepts, functions, and structures of operating systems, and apply various CPU scheduling algorithms. **CLO-2** Grasp memory hierarchy, allocation techniques, paging, segmentation, virtual memory concepts, and file system management. **CLO-3** Learn the history, features, and architecture of Linux, perform basic file operations, and write simple shell scripts. **CLO-4** Manage processes, users, and groups in Linux, utilize network commands, perform system administration tasks, and understand basic security measures.

Instructions for Paper- Setter: The examiner will set 9 questions asking two questions from each unit and one compulsory question by taking course learning outcomes (CLOs) into consideration. The compulsory question (Question No. 1) will consist at least 4 parts covering entire syllabus. The examinee will be required to attempt 5 questions, selecting one question from each unit and the compulsory question. All questions will carry equal marks.

Unit	Topics	Contact Hours
I	Introduction to Operating Systems: Definition, types, and functions of an operating system; System Structures: Operating system services, system calls, system programs, and system structure; Process Management: Process concept, process scheduling, operations on processes, inter-process communication; CPU Scheduling: Scheduling criteria, scheduling algorithms (FCFS, SJF, Priority, Round Robin, Multilevel Queue Scheduling).	15
II	Memory Management: Memory Hierarchy, Types of memory, memory allocation techniques; Paging and Segmentation: Basic concepts, paging, segmentation, segmentation with paging; Virtual Memory: Demand paging, page replacement algorithms, allocation of frames, thrashing; File Systems: File concepts, access methods, directory and disk structure, file system mounting, file sharing, protection.	15
III	Introduction to Linux: History, features, architecture of Linux; Linux File System: File and directory structure, file permissions, standard file types; Basic Commands: File and directory operations (ls, cp, mv, rm, mkdir), text processing (cat, grep, sort), system status (ps, top, df, du); Shell Scripting: Introduction to shell, shell variables, control structures (if, case, while, for), writing simple shell scripts.	15
IV	Process Management in Linux: Managing processes (ps, top, kill, nice), job scheduling (cron, at); User and Group Management: Creating and managing users and groups, file permissions,	15

	changing ownership (chown, chgrp); Networking in Linux: Basic network commands (ifconfig, ping, netstat, ssh), configuring network interfaces; System Administration: Package management (installing and removing software using rpm, dpkg, apt-get), backup and restore, logging; Security: Basic security concepts, user authentication.

The compulsory question (Question No. 1) will consist at least 4 parts covering entire syllabus. The examinee will be required to attempt 5 questions, selecting one question from each unit and the compulsory question. All questions will carry equal marks.

Unit	Topics	Contact Hours
I	Introduction: Algorithmic notation – Programming principles – Creating programs- Analyzing programs. Arrays: One dimensional array, multidimensional array, pointer arrays. Searching: Linear search, Binary Search, Fibonacci search. Sorting techniques: Internal sorting - Insertion Sort, Selection Sort, Shell Sort, Bubble Sort, Quick Sort, Heap Sort, Merge Sort and Radix Sort.	15
II	Stacks: Definition – operations - applications of stack. Queues: Definition - operations - Priority queues – Dequeues – Applications of queue. Linked List: Singly Linked List, Doubly Linked List, Circular Linked List, linked stacks, Linked queues, Applications of Linked List – Dynamic storage management – Generalized list.	15
III	Trees: Binary tree, Terminology, Representation, Traversals, Applications – Binary search tree – AVL tree. B Trees: B Tree indexing, operations on a B Tree, Lower and upper bounds of a B Tree - B + Tree Indexing – Trie Tree Indexing.	15
IV	Graph: Terminology, Representation, Traversals – Applications - spanning trees, shortest path and Transitive closure, Topological sort. Sets: Representation - Operations on sets – Applications. Files: queries - Sequential organization – Index techniques. External sorting.	15

The examinee will be required to attempt 5 questions, selecting one question from each unit and the compulsory question. All questions will carry equal marks.

Unit	Topics	Contact Hours
I	Introduction to Java: History, features, and applications; Basics of Java programming: Syntax, variables, data types, operators, expressions, and statements; Control flow: Decision-making statements (if, else-if, switch), looping statements (for, while, do-while), and branching; Methods: Declaring methods, passing parameters, method overloading, and recursion; Arrays: Declaring, initializing, and manipulating arrays. Array operations and algorithms.	15
II	Classes and Objects: Declaring classes, creating objects, constructors, and instance variables; Encapsulation: Access modifiers (public, private, protected, default), getters, and setters; Inheritance: Extending classes, method overriding, super keyword, and method overloading; Polymorphism: Method overriding, dynamic method dispatch, and abstract classes; Interfaces: Defining interfaces, implementing interfaces, and using interface references; Packages: Creating and using packages, importing classes and packages.	15
III	Exception Handling: Understanding exceptions, try-catch block, throw and throws keywords, and finally block; File Handling: Reading from and writing to files using FileInputStream, FileOutputStream, FileReader, and FileWriter; Multithreading: Creating threads, thread lifecycle,	15

	synchronization, thread communication. Applet programming, Applet life Cycle, Applet Graphics programming.	
IV	Event Handling: AWT Classes, ActionListener, MouseListener, MouseMotionListener, Layout managers, Generics: Introduction to generics, generic classes and generic methods, Java Database Connectivity (JDBC): Connecting to databases, executing SQL queries, handling transactions, and managing resources; GUI Programming: Introduction to Swing for creating graphical user interfaces (GUIs).	15

Part B- Contents of the Course

Practicals	Contact Hours
Practical course will consist of two components Part-A and Part-B. The examiner will set 5 questions at the time of practical examination asking 2 questions from the Part-A and 3 questions from the Part-B by taking course learning outcomes (CLO) into consideration. The examinee will be required to solve one problem from the Part-A and to write and execute 2 questions from the Part-B.	120
Part-A **HTML/CSS Basics:** • Creating a webpage structure with HTML. • Styling the webpage using CSS (inline, internal, and external styles). **Responsive Design:** Making the webpage responsive using media queries. Using frameworks like Bootstrap for responsive design. **JavaScript Basics:** Adding interactivity with JavaScript (DOM manipulation, event handling). Working with variables, loops, and conditions. **Frameworks and Libraries:** • Using front-end frameworks React. • Utilizing libraries such as jQuery for DOM manipulation. **Introduction to React:** • Create a simple React component that displays "Hello, World!" on the screen. • Use JSX syntax and explain its advantages over plain JavaScript. **State and Props:** • Build a component that takes props and renders them. • Implement state in a component and update it based on user interaction (e.g., button click). **Basic Todo App:** Develop a Todo application where users can add, delete, and mark tasks as completed. Use state to manage the list of tasks. **Using React Router:** • Set up React Router in a project and create multiple pages (e.g., Home, About,	60

Contact). • Implement navigation between these pages using Link and NavLink. **Redux Integration:** • Integrate Redux for state management in a React application. • Implement actions, reducers, and connect components to Redux store. **Responsive Design with React Router:** • Build a responsive multi-page application using React Router. • Ensure layout adjustments for different screen sizes using CSS media queries or frameworks like Bootstrap.	
Part-B 1) Implement a simple program demonstrating the creation and synchronization of threads or processes. 2) Design and simulate a memory management system (e.g., paging, segmentation). 3) Implement algorithms like First Fit, Best Fit, and Worst Fit for memory allocation. 4) Implement a basic file system with operations like file creation, deletion, reading, and writing. 5) Compare different file allocation methods (e.g., contiguous allocation, linked allocation, indexed allocation). 6) Solve synchronization problems such as the producer-consumer problem or dining philosophers problem using semaphores or mutexes. 7) Implement a solution for deadlock prevention, avoidance, or detection. 8) Profile and analyze the performance of different scheduling algorithms (e.g., FCFS, SJF, Round Robin) using simulations. 9) Evaluate the impact of caching and paging strategies on system performance. 10) Write a shell script named hello.sh that prints "Hello, World!" to the terminal when executed. 11) Demonstrate running the script and explain how to make it executable using chmod. 12) Write a script greet_user.sh that prompts the user for their name and then prints a personalized greeting. 13) Use variables to store user input and demonstrate the use of read command. 14) Create a script check_number.sh that accepts a number as an argument. 15) Check if the number is positive, negative, or zero, and print an appropriate message using conditional statements (if-else). 16) Develop a script countdown.sh that takes a number as input and prints a countdown from that number to 1. 17) Use a loop (e.g., while or for) to implement the countdown. 18) Write a script file_info.sh that accepts a filename as an argument. 19) Check if the file exists and whether it is a regular file or directory. Display appropriate messages based on the checks. 20) Create a script word_count.sh that reads a text file (provided as an argument) and counts the number of words in the file. 21) Utilize command-line tools like wc and cat for reading and counting words.	60 (Lab hours include instructions for writing programs and demonstration by a teacher and for running the programs on computer by students.)

Suggested Evaluation Methods

Internal Assessment: 30		**End Term Examination: 70**

Part B- Contents of the Course

Practicals	**Contact Hours**
Practical course will consist of two components Part-A and Part-B. The examiner will set 5 questions at the time of practical examination asking 2 questions from the Part-A and 3 questions from the Part-B by taking course learning outcomes (CLO) into consideration. The examinee will be required to solve one problem from the Part-A and to write and execute 2 questions from the Part-B.	120
Part-A **Task 1: Linked List Implementation** • Implement a singly linked list in a programming language of your choice (e.g., C/C++, Java, Python). • Include functions/methods for insertion (at the beginning, end, and specific position), deletion, and traversal. **Task 2: Stack Operations** • Implement a stack using an array or linked list. • Include functions/methods for push, pop, peek, and checking if the stack is empty or full. **Task 3: Queue Implementation** • Implement a queue using an array or linked list. • Include functions/methods for enqueue, dequeue, peek, and checking if the queue is empty or full. **Task 4: Binary Search Tree (BST) Operations** • Implement a binary search tree (BST) in your chosen programming language. • Include functions/methods for insertion, deletion, searching for a key, finding minimum and maximum values, and traversing the tree (inorder, preorder, postorder). **Task 6: Sorting Algorithms** • Implement at least two sorting and searching algorithms (e.g., selection sort, insertion sort, merge sort, quick sort).	60

• Compare their time complexity and performance using different input sizes. **Task 7: Graph Representation and Algorithms** • Implement an adjacency list representation of a graph. • Include functions/methods for BFS (Breadth-First Search) and DFS (Depth-First Search) traversal of the graph.	
Part-B 1) Write a Java program that converts temperatures between Celsius and Fahrenheit based on user input using methods for conversion and input validation. 2) Implement a Java program to perform matrix addition, multiplication, and transpose operations using arrays and methods. 3) Develop a Java program that converts a decimal number to its binary, octal, and hexadecimal equivalents using loops and methods. 4) Create a Java program to simulate a simple bank account management system with features like deposit, withdrawal, and balance inquiry using classes, objects, and encapsulation. 5) Write a Java program that reads a text file, counts the occurrences of each word, and displays the top N most frequent words using HashMap for storage and sorting. 6) Implement a Java program to generate the first N prime numbers using a combination of loops, methods, and optimizations like the Sieve of Eratosthenes algorithm. 7) Develop a Java program that takes a month and year as input and prints the calendar for that month using control flow statements and loops for date calculation. 8) Write a Java program that generates different number patterns like pyramid patterns using nested loops and methods for pattern printing. 9) Create a Java program to manage an employee payroll system with features for adding employees, calculating salaries based on hours worked or monthly salary, and generating pay slips using classes, inheritance, and polymorphism. 10) Implement Java programs to compare the performance of different sorting algorithms (like quicksort, mergesort, and heapsort) on large arrays of integers, measuring and analyzing time complexity. 11) Develop a Java program that recursively searches a directory for files matching a given pattern and displays the file paths using recursion and file handling classes. 12) Write a Java program to perform arithmetic operations (addition, subtraction, multiplication, division) on large numbers using BigInteger class and exception handling for division by zero. 13) Implement a Java program to solve the Tower of Hanoi problem for N disks using recursion, demonstrating the steps and movements required. 14) Write a Java program to find the largest and smallest elements in an array. 15) Implement a Java program to sort an array of integers using bubble sort. 16) Create a Java program to find the frequency of each element in an array. 17) Develop a Java program to reverse an array without using an additional array. 18) Write a Java program to merge two sorted arrays into a single sorted array. 19) Define a Java class representing a Student with private instance variables and public getter and setter methods. 20) Create a Java program to demonstrate constructor overloading in a class. 21) Implement a Java program to calculate the area and perimeter of a rectangle using a class and object. 22) Develop a Java program to implement inheritance by creating a base class Animal and derived classes like Dog and Cat. 23) Write a Java program to demonstrate method overriding by implementing a base class Shape and derived classes like Circle and Rectangle.	60 (Lab hours include instructions for writing programs and demonstration by a teacher and for running the programs on computer by students.)

BC-1 Computer Fundamentals and Problem Solving Through C

With effect from Session: 2025-26			
Part A - Introduction			
Name of the Programme	MCA		
Semester	1st		
Name of the Course	Computer Fundamentals and Problem Solving Through C		
Course Code	M24-CAP-108		
Course Type	BC-1		
Level of the course (As per Annexure-I	400-499		
Pre-requisite for the course (if any)	-		
Course Objectives	The objective of this course is to provide a foundational understanding of computer systems, including hardware and software components, and to introduce essential concepts of digital systems, number systems, and Boolean logic. The course also aims to develop proficiency in programming using the C language, focusing on control structures, functions, data structures, and pointers. By the end of the course, students will be able to apply fundamental programming techniques to solve computational problems and have a strong grasp of the underlying principles of digital logic and computing.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	CLO-1. Students will be able to explain the basic organization of a computer and understand the purpose and methods of program planning using algorithms, flowcharts, and pseudocodes. CLO-2. Students will develop the ability to represent and manipulate information using various number systems, binary arithmetic, and Boolean logic. CLO-3. Students will acquire proficiency in programming with the C language, including the use of data types, operators, control structures, and input/output operations. CLO-4. Students will demonstrate the ability to create modular programs in C using functions, effectively manage data structures such as arrays, strings, and files, and work with pointers to manipulate memory and data efficiently.		
Credits	Theory	Practical	Total
	0	0	0
Teaching Hours per week	4	0	4
Internal Assessment Marks	30	0	30
End Term Exam Marks	70	0	70
Max. Marks	100	0	100
Examination Time	3 hours		

Part B- Contents of the Course

Instructions for Paper- Setter: The examiner will set 9 questions asking two questions from each unit and one compulsory question by taking course learning outcomes (CLOs) into consideration. The compulsory question (Question No. 1) will consist at least 4 parts covering entire syllabus. The examinee will be required to attempt 5 questions, selecting one question from each unit and the compulsory question. All questions will carry equal marks.

Unit	Topics	Contact Hours
I	Computer Fundamentals: Basics of computers, basic computer organization, storage hierarchy, storage devices, input-output devices. Computer Software. Introduction to operating systems. Planning the computer program: Purpose of program planning, algorithm, flowcharts, decision tables, pseudocodes.	15
II	Digital Fundamentals: Information representation - number systems, number system conversion; Computer codes - BCD code, EBCDIC code, ASCII, Unicode; Binary arithmetic; Binary logic -	15

	Boolean algebra, Boolean functions, truth table, simplification of Boolean functions (upto 4 variables only), K-map, digital logic gates.	
III	Elements of C language: C character set, identifiers & keywords, data types: declaration & definition. Operators: Arithmetic relational, logical, bitwise, unary, assignment and conditional operators & their hierarchy & associativity, Data input/output. Control statements: Sequencing, Selection: if and switch statement; iteration: for, while, and do-while loop; break, continue, goto statement.	15
IV	Functions in C language: Definition, prototype, passing parameters, recursion, Data structure: arrays, structures, union, string, data files. Pointers: Declaration, operations on pointers, array of pointers, pointers to arrays.	15
	Total Contact Hours	60

Suggested Evaluation Methods			
Internal Assessment: 30		**End Term Examination: 70**	
➢ **Theory**	**30**	➢ **Theory**	**70**
• Class Participation:	5	Written Examination	
• Seminar/presentation/assignment/quiz/class test etc.:	10		
• Mid-Term Exam:	15

Part A - Introduction			
Name of the Programme	MCA		
Semester	I[st]		
Name of the Course	Practical-3		
Course Code	M24-CAP-109		
Course Type	BC-2		
Level of the course	400-499		
Pre-requisite for the course (if any)			
Course objectives	This course focuses on hands-on experience with computer fundamentals. They will engage in program planning by creating and testing algorithms, flowcharts, and pseudocodes. Practical sessions will deepen their understanding of digital fundamentals through exercises on number systems, Boolean logic, and binary arithmetic. The course will provide extensive practice in C programming, allowing students to implement various data types, control structures, functions, and pointers in real-world coding tasks.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	**CLO-1:** Design and implement efficient algorithms using flowcharts, pseudocodes, and decision tables to solve complex problems. **CLO-2:** Write C programs that demonstrate a strong understanding of control structures, data types, and operators to create optimized solutions. **CLO-3:** Develop modular C programs using functions, effectively managing code complexity and promoting reusability. **CLO-4:** Utilize pointers and data structures in C to enhance program efficiency and handle dynamic memory management in real-world applications.

Part B- Contents of the Course

Practicals	**Contact Hours**
The examiner will set 3 questions at the time of practical examination by taking course learning outcomes (CLO) into consideration. The examinee will be required to write and execute 2 questions.	60
1) Implement a program using the conditional (ternary) operator to find the largest of three numbers. 2) Create a C program that acts as a simple calculator, performing addition, subtraction, multiplication, or division based on user input using the switch statement. 3) Write a program that uses `if-else` statements to determine whether a given year is a leap year or not. 4) Develop a C program using a `for` loop to print the multiplication table of a given number up to 10. 5) Write a C program to calculate the factorial of a number using both `while` and `do-while` loops. 6) Implement a program that uses `break` and `continue` statements within a loop to skip printing even numbers and stop the loop if the number exceeds 50. 7) Write a C program with a function that takes an integer as input and returns the square of the number. Call this function from `main()`. 8) Develop a program that includes a function to calculate the area of a circle given the radius. Use `float` as the return type. 9) Create a C program that calculates the nth Fibonacci number using recursion. 10) Write a program that uses a function to find the maximum value in an integer array.	60 (Lab hours include instructions for writing programs and demonstration by a teacher and for running the programs on computer by students.)

The array should be passed to the function as a parameter.

11) Implement a program that uses functions to reverse a string and check if the string is a palindrome.
12) Write a C program that defines a structure to store student details (name, roll number, marks in three subjects) and calculates the total and average marks. Use a union to demonstrate memory sharing between different types.
13) Pointers in C Language
14) Pointer Basics: Write a program that demonstrates the use of pointers by printing the address and value of a variable using both the variable itself and a pointer to the variable.
15) Create a C program to store an array of strings (names of students) using an array of pointers. Display the names in reverse order.
16) Implement a program that uses a pointer to a function to pass a function as a parameter to another function, e.g., passing a function that calculates the square of a number to another function that prints it.

Part A - Introduction			
Name of the Programme	MCA		
Semester	2nd		
Name of the Course	Server Side Web Technology		
Course Code	M24-CAP-201		
Course Type	CC-5		
Level of the course (As per Annexure-I	400-499		
Pre-requisite for the course (if any)	-		
Course Objectives	This course provides an in-depth understanding of web servers, client-server architecture, and Node.js, focusing on non-blocking I/O, event-driven programming, and package management. Students will learn to handle files, build HTTP servers, and manage asynchronous tasks while mastering error handling and debugging. With Express.js, they will design RESTful APIs, implement routing and middleware, and integrate user authentication. The course also introduces MongoDB for NoSQL database operations, including CRUD and indexing, equipping students to build scalable, secure web applications.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	**CLO-1:** Students will be able to set up a Node.js environment, understand its non-blocking I/O and event-driven architecture, and manage packages and modules effectively. **CLO-2:** Students will gain the ability to handle files and directories, create robust HTTP servers, and implement event-driven programming while managing asynchronous tasks and debugging errors. **CLO-3:** Students will be able to develop Express.js applications with structured routing, middleware, and RESTful APIs, including secure user authentication using JWT and sessions. **CLO-4:** Students will learn to set up and manage MongoDB databases, perform CRUD operations, and utilize indexes to optimize query performance for NoSQL applications.

Instructions for Paper- Setter: The examiner will set 9 questions asking two questions from each unit and one compulsory question by taking course learning outcomes (CLOs) into consideration. The compulsory question (Question No. 1) will consist at least 4 parts covering entire syllabus. The examinee will be required to attempt 5 questions, selecting one question from each unit and the compulsory question. All questions will carry equal marks.

Unit	Topics	Contact Hours
I	Introduction to web servers, Client-Server Architecture, Request-Response Cycle, Server-Side vs. Client-Side. Introduction to Node.js: Overview of Node.js, Non-blocking I/O, Event-driven architecture, Benefits of using Node.js in the MERN stack. Installing Node.js, Using Node Package Manager (npm), Creating and managing packages. Modules: Working with core modules, Creating and importing custom modules, require and exports.	15
II	File handling: Reading from and writing to files, Handling directories, Managing asynchronous tasks efficiently. Building Web Servers: Creating a basic HTTP server, Handling HTTP requests and responses, Understanding request methods (GET, POST, PUT, DELETE). Event-Driven Programming Using EventEmitter, Creating custom events, Handling real-	15

	time data. Error Handling and Debugging: Try-catch blocks, Handling asynchronous errors, Using debugging tools (e.g., node --inspect, Chrome DevTools).	
III	Express.js Basics: Introduction to Express.js, Setting up Express projects, Understanding routing and middleware. Using template engines (e.g., EJS) for server-side rendering, Designing RESTful APIs, CRUD operations, Structuring API routes. Built-in middleware (e.g., body-parser), Creating custom middleware, Error handling middleware. User authentication using JWT (JSON Web Tokens) and sessions.	15
IV	Introduction to MongoDB: NoSQL vs. SQL databases, Setting up MongoDB locally and on cloud (e.g., MongoDB Atlas), Document-based NoSQL database, JSON-like documents. Setting Up MongoDB: Installation, creating databases, collections, and documents CRUD Operations in MongoDB: Inserting, querying, updating, deleting documents Indexes in MongoDB: Creating and using indexes	15

Course Objectives	The course aims to provide a comprehensive understanding of network characterization, design issues, and service models, focusing on the OSI and TCP/IP reference models and their practical applications. It covers data communication concepts, including performance parameters, transmission media, modulation techniques, and switching methods, emphasizing the role of wired and wireless networks. The course delves into the data link layer, exploring protocols, error detection, media access, and IEEE standards, alongside advancements in wireless technologies like Wi-Fi, Wi-Max, and Bluetooth. It further examines the transport and network layers, addressing routing algorithms, congestion control, and QoS mechanisms, with a detailed focus on IPv4, IPv6, and protocols like TCP and UDP.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	**CLO-1:** characterize various types of computer networks and standards along with an insight into the principles of networking by using protocol layering of the Internet and the TCP/IP protocol suite. **CLO-2:** comprehend the notion of data communication and its related functional components and aspects. **CLO-3:** understand design issues related to Local area Networks and get acquainted with the prevailing wired and wireless LAN technology standards. **CLO-4:** get versed with the routing, addressing, congestion control, and security issues in Networks and the Internet architecture .

Pre-requisite for the course (if any)	-		
Course Objectives	This course provides a comprehensive understanding of database concepts, including the three-schema architecture, relational models, and the ER model. It covers SQL and PL/SQL for database management, exploring queries, constraints, and advanced functions. Students will learn relational algebra, normalization techniques, and query optimization to enhance database design and performance. The course also addresses transaction processing, concurrency control, and database recovery, emphasizing reliability, consistency, and security in database systems.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	**CLO-1**: Understand and apply the three-schema architecture, data independence, and entity-relationship modeling to design effective database schemas. **CLO-2**: Develop and execute SQL and PL/SQL queries, including advanced operations like joins, constraints, triggers, and aggregate functions, for robust database management. **CLO-3**: Analyze relational algebra operations and apply normalization techniques to optimize database structure and ensure data integrity. **CLO-4**: Demonstrate knowledge of transaction processing, concurrency control methods, and database recovery techniques to maintain database reliability and security.

With effect from Session: 2025-26			
Part A - Introduction			
Name of the Programme	MCA		
Semester	2nd		
Name of the Course	Practical-4		
Course Code	M24-CAP-205		
Course Type	PC-3		
Level of the course	400-499		
Pre-requisite for the course (if any)			
Course objectives	This course aims to provide hands-on experience in building web applications and understanding networking concepts. Part A focuses on mastering server-side development with Node.js and Express.js, enabling students to design efficient applications integrated with databases like MongoDB. Part B emphasizes networking principles, offering insights into data transmission, error detection, routing, and network protocols through programming and simulation, preparing students for real-world applications in web development and network administration.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	**CLO-1:** and implement server-side applications using Node.js and Express.js, including handling HTTP methods, managing file operations, and building RESTful APIs integrated with MongoDB for CRUD operations and authentication. **CLO-2:** Demonstrate the ability to use Node.js core modules, custom modules, middleware, and debugging tools to build dynamic, efficient, and error-resilient web applications. **CLO-3:** Analyze and implement networking concepts and protocols, including OSI and TCP/IP models, socket programming, and data transmission methods, using Python or C++. **CLO-4:** Apply algorithms and techniques in networking, such as error detection (CRC), routing (Dijkstra's algorithm), and flow control protocols (Go-Back-N, Selective Repeat), through programming and simulation tools.

Examination Time	0	4 hours	

Part B- Contents of the Course	
Practicals	**Contact Hours**
Practical course will consist of two components Part-A and Part-B. The examiner will set 5 questions at the time of practical examination asking 3 questions from the Part-A and 2 questions from the Part-B by taking course learning outcomes (CLO) into consideration. The examinee will be required to solve one problem from the Part-A and one from the Part-B.	120
Part-A 1) Set up a simple HTTP server in Node.js that responds with "Hello, World!" when accessed via a browser. 2) Illustrate the client-server architecture by creating a basic web application that sends a request to the server and displays the response in the browser. 3) Implement a program to demonstrate the request-response cycle by logging HTTP request headers and returning a JSON response. 4) Compare server-side and client-side operations by creating a simple application where the server processes data and the client displays it. 5) Install Node.js and initialize a new project using npm. Create and manage packages using `package.json`. 6) Write a program using Node.js core modules like `fs` and `os` to read system	60

information and save it to a file. 7) Create a custom module for string manipulation (e.g., reversing, converting to uppercase) and use it in a Node.js script. 8) Write a Node.js program to read and write data to a text file asynchronously, logging success or error messages to the console. 9) Create a script to list all files and directories in a specified folder and display them hierarchically. 10) Implement a program that manages a directory: creating it if it doesn't exist, adding files, and deleting files. 11) Build a basic HTTP server in Node.js that supports different HTTP methods (GET, POST, PUT, DELETE) and logs each request. 12) Create a server that serves static files (e.g., HTML, CSS, JS) from a public directory. 13) Use the `EventEmitter` class to create and emit custom events, such as notifying users when a file operation is completed. 14) Implement a real-time data handler using events, simulating a live stock ticker system. 15) Create a script that performs file operations and uses `try-catch` blocks to handle file-not-found errors gracefully. 16) Debug a Node.js script using `node --inspect` and Chrome DevTools, identifying and fixing a logical error. 17) Create a basic Express.js application to handle routing for `/home`, `/about`, and `/contact` with respective responses. 18) Develop a RESTful API using Express.js to manage a list of books (CRUD operations). 19) Set up a server-side rendering engine (EJS) to dynamically generate HTML pages with user data. 20) Implement custom middleware in an Express.js application to log request details and handle errors. 21) Implement a JWT-based authentication system for a RESTful API, allowing users to register and log in. 22) Create an Express.js application to demonstrate session management for user login and logout. 23) Install MongoDB locally and create a database called `school`. Add a `students` collection and insert sample documents. 24) Use MongoDB Atlas to create a cloud-hosted database and connect to it using Node.js. 25) Write a script to query MongoDB for documents with specific conditions, such as retrieving students with grades above 80. 26) Develop a Node.js script to perform CRUD operations on a `products` collection in MongoDB. 27) Create an Express.js application that connects to MongoDB and exposes APIs for CRUD operations on a `tasks` collection. 28) Add indexes to a MongoDB collection and demonstrate their impact on query performance by measuring execution time before and after indexing. 29) Write a script that creates a compound index on multiple fields in a collection and tests its effectiveness with specific queries.	
Part-B 1) Compare the OSI and TCP/IP reference models by creating a document that maps the functionality of each layer. 2) Develop a Python script to simulate data transmission using TCP/IP sockets between a client and server. 3) Write a program to calculate Nyquist Bit Rate and Shannon Capacity for a given set of inputs (bandwidth, signal levels, noise). 4) Implement 4B/5B encoding for a given binary sequence using Python or C++. 5) Implement time-division multiplexing for multiple signals using Python. 6) Compare ADSL and cable broadband connections by analyzing speed, latency, and reliability. 7) Simulate and test the operation of sliding window flow control protocols (Go-Back-N and Selective Repeat). 8) Write a program to implement error detection using CRC (Cyclic Redundancy Check). 9) Implement the Binary Exponential Backoff algorithm and simulate its role in collision	60 (Lab hours include instructions for writing programs and demonstration by a teacher and for running the programs on computer by students.)

resolution.

10) Implement a shortest path routing algorithm (e.g., Dijkstra's algorithm) to find the optimal path in a simulated network.

Suggested Evaluation Methods			
Internal Assessment: 30		**End Term Examination: 70**	
➢ **Practicum**	**30**	➢ **Practicum**	**70**
• Class Participation:	5	Lab record, Viva-Voce, write-up and execution of the programs

Part A - Introduction			
Name of the Programme	MCA		
Semester	2nd		
Name of the Course	Practical-5		
Course Code	M24-CAP-206		
Course Type	PC-4		
Level of the course	400-499		
Pre-requisite for the course (if any)			
Course objectives	The primary objective of this course is to equip students with the theoretical knowledge and practical skills necessary to solve complex computational problems. Through Part A, students will gain expertise in database design, implementation, and optimization, leveraging advanced SQL and PL/SQL techniques. Part B focuses on problem-solving using search algorithms, state-space representations, and optimization methods such as Genetic Algorithms, enabling students to tackle challenges in AI and operations research efficiently.		
Course Learning Outcomes (CLO) After completing this course, the learner will be able to:	**CLO-1:** Analyze, design, and implement database schemas for real-world applications such as library management, hospital management, and e-commerce systems, while applying concepts of ER diagrams, relational schema, normalization, and functional dependencies. **CLO-2:** Demonstrate the ability to write and optimize SQL queries, implement advanced database features such as views, indexes, triggers, cursors, and perform database operations using relational algebra and PL/SQL programming. **CLO-3:** Formulate and implement state-space representations, search algorithms (BFS, DFS, Iterative Deepening DFS), and production systems to solve complex problems like puzzles, mazes, and water-jug problems. **CLO-4:** Design and develop solutions using Genetic Algorithms by encoding chromosomes, defining fitness functions, and applying these techniques to solve optimization problems like the Travelling Salesman Problem (TSP) and mathematical function maximization.

Part B- Contents of the Course

Practicals	**Contact Hours**
Practical course will consist of two components Part-A and Part-B. The examiner will set 5 questions at the time of practical examination asking 3 questions from the Part-A and 2 questions from the Part-B by taking course learning outcomes (CLO) into consideration. The examinee will be required to write and execute 2 questions from the Part-A and one from the Part-B.	120
Part-A 1) Create an ER diagram for a library management system that includes entity types, attributes, keys, relationships, and instances. 2) Convert the ER diagram into relational schemas and define the primary and foreign keys. 3) Implement a database schema in a DBMS for an e-commerce application. Define the constraints, such as NOT NULL, UNIQUE, CHECK, and FOREIGN KEY. 4) Create a database for a hospital management system. Define tables for doctors, patients, appointments, and prescriptions. 5) Perform basic operations such as inserting, updating, and deleting records. 6) Write queries to retrieve data from multiple tables using INNER JOIN, LEFT JOIN, RIGHT JOIN, and FULL OUTER JOIN. 7) Create a query to find patients who have visited a specific doctor using JOIN. 8) Create a view to display the total number of patients attended by each doctor. 9) Add an index to optimize the search for patients by their last names. 10) Write a PL/SQL program to implement a banking transaction system that transfers money	60

between two accounts. Use COMMIT and ROLLBACK statements. 11) Create a cursor to fetch and display all overdue book records from a library database. 12) Develop a trigger to automatically update the stock count when a new product is added to an inventory database. 13) Write and execute queries in relational algebra for the following operations: selection, projection, union, intersection, difference, Cartesian product, and join for a student database. 14) Identify functional dependencies in a given database (e.g., a university database). 15) Normalize the database to 1NF, 2NF, 3NF, and BCNF, showing each step of decomposition. 16) Write an inefficient query for fetching data from a large database. Use EXPLAIN PLAN to analyze it and optimize the query using indexes and appropriate joins.	
Part-B 1) Formulate a state-space representation for the "8-puzzle problem." Represent states, actions, and transitions clearly and define the goal state. 2) Implement Breadth-First Search (BFS) to solve a maze where the start and goal positions are specified. 3) Use Depth-First Search (DFS) to navigate through a graph of cities and find a path from a given source to a destination. 4) Apply Iterative Deepening DFS to solve a water-jug problem (e.g., measure exactly 4 liters using a 3-liter and a 5-liter jug). 5) Develop a production system to solve the "Tower of Hanoi" problem. 6) Write a program to implement a Genetic Algorithm to maximize a mathematical function (e.g., $f(x)=x2,0\leq x\leq 31$). Demonstrate the use of binary encoding for chromosomes. 7) Define a fitness function for solving the "Travelling Salesman Problem (TSP)" using a Genetic Algorithm.	60 (Lab hours include instructions for writing programs and demonstration by a teacher and for running the programs on computer by students.)

Instructions for Paper- Setter: The examiner will set 9 questions asking two questions from each unit and one compulsory question by taking course learning outcomes (CLOs) into consideration. The compulsory question (Question No. 1) will consist at least 4 parts covering entire syllabus. The examinee will be required to attempt 5 questions, selecting one question from each unit and the compulsory question. All questions will carry equal marks.

Unit	Topics	Contact Hours
I	Sets: Set theory: Basic concept, set types, set operations, cardinality, and notation. Relations: Relations and its representations, Properties of binary relation –Reflexive, symmetric, Asymmetric, transitive, Equivalence, Inverse & Composition of a relation, closure of relations, its types, Partial ordering relation, Hasse diagram, minimal elements, upper bound, lower bound, Lattices Functions: definition, floor functions, ceiling functions, surjective, injunctive and bijective functions, Inverse Function, Composition of functions, recursive Functions, Pigeon hole principles and its application.	15
II	Addition and multiplication of matrices, Laws of matrix algebra, Singular and non-singular matrices, Inverse of a matrix, Systems of linear equations, Eigen values and Eigen vectors, Diagonalization of a square matrix. Interpolation, Numerical Integration and Differentiation.	15
III	Statistical Methods: Definition and scope of Statistics, concepts of statistical population and sample. Data: Quantitative and qualitative, attributes, variables, scales of measurement nominal, ordinal, interval and ratio. Presentation: tabular and graphical, including histogram and ogives. Measures of Central Tendency: Mean, Median, Mode. Measures of Dispersion: range, quartile deviation, mean deviation, standard deviation, coefficient of variation, Moments, skewness and kurtosis. Statistical Methods: Definition and scope of Statistics, concepts of statistical population and sample. Data: Quantitative and qualitative, attributes, variables, scales of measurement nominal, ordinal, interval and ratio. Presentation: tabular and graphical, including histogram and ogives. Measures of Central Tendency: Mean, Median, Mode. Measures of Dispersion: range, quartile deviation, mean deviation, standard deviation, coefficient of variation, Moments, skewness and kurtosis.	15
IV	Bivariate data: Definition, scatter diagram, simple, partial and multiple correlation (3 variables only), rank	15

	correlation. Simple linear regression, principle of least squares and fitting of polynomials and exponential curves. Probability: Introduction, random experiments, sample space, events and algebra of events. Definitions of Probability – classical, statistical, and axiomatic. Conditional Probability, laws of addition and multiplication, independent events, theorem of total probability, Bayes' theorem and its applications.

Practicals	**Contact Hours**
The examiner will set 3 questions at the time of practical examination by taking course learning outcomes (CLO) into consideration. The examinee will be required to write and execute 2 questions.	60
1) Set Operations: Write a program to perform union, intersection, difference, and symmetric difference on two sets. 2) Cardinality: Implement a program to calculate the cardinality of a given set. 3) Binary Relation Properties: Write a program to check whether a given binary relation is reflexive, symmetric, asymmetric, or transitive. 4) Hasse Diagram: Create a program to generate a Hasse diagram for a partial ordering relation. 5) Lattices: Write a program to verify whether a given set with a partial order forms a lattice. 6) Functions: Implement a program to check whether a function is injective, surjective, or bijective. 7) Recursive Functions: Write a program to compute the factorial of a number using recursion and apply it to solve problems using pigeonhole principles. 8) Pigeonhole Principle: Write a program to prove the pigeonhole principle for a given input set. 9) Matrix Operations: Write a program to add, subtract, and multiply two matrices. 10) Inverse of a Matrix: Implement a program to find the inverse of a square matrix using Gauss-Jordan elimination. 11) Eigenvalues and Eigenvectors: Write a program to compute the eigenvalues and eigenvectors of a square matrix. 12) System of Linear Equations: Create a program to solve a system of linear equations using Gaussian	60 (Lab hours include instructions for writing programs and demonstration by a teacher and for running the programs on computer by students.)

elimination.

13) Diagonalization: Write a program to diagonalize a square matrix if possible.
14) Interpolation: Implement a program to perform Lagrange or Newton interpolation for a given set of points.
15) Numerical Integration: Write a program to compute the definite integral of a function using the trapezoidal or Simpson's rule.
16) Numerical Differentiation: Create a program to find the derivative of a function using finite difference methods.
17) Data Presentation: Write a program to create a histogram and ogive for a given data set.
18) Measures of Central Tendency: Implement a program to calculate mean, median, and mode for a given data set.
19) Measures of Dispersion: Write a program to compute range, quartile deviation, mean deviation, standard deviation, and coefficient of variation for a data set.
20) Moments, Skewness, and Kurtosis: Create a program to calculate the moments of a distribution and determine its skewness and kurtosis.
21) Tabular Representation: Write a program to present data in tabular form based on user input (quantitative or qualitative).
22) Scatter Diagram: Write a program to generate a scatter plot for bivariate data and compute the correlation coefficient.
23) Regression: Implement a program to compute the equation of a simple linear regression line and predict values based on the model.
24) Polynomial Fitting: Write a program to fit a polynomial curve using the principle of least squares.
25) Exponential Curve Fitting: Create a program to fit an exponential curve to a given data set.
26) Probability Calculations: Write a program to compute probabilities using classical, statistical, and axiomatic definitions.
27) Conditional Probability: Implement a program to calculate conditional probability and verify the laws of addition and multiplication.
28) Bayes' Theorem: Write a program to solve problems using Bayes' theorem.
29) Random Events Simulation: Create a program to simulate random experiments, generate a sample space, and calculate probabilities.
